TUE A · CONFLICTS, INCONSISTENCIES, AND WHAT WAS NOT CLEAR

Claude read your scope document against your four attachments. One line each.

If nothing was wrong and the writing was just unfollowable, put "neither, just unclear" in the middle column and say what you rewrote.

What it found	Which was right	What I changed
Section 3 says the board deck is excluded because it "depends on an outside accounting firm's process, not something inside Elevate's control alone." No transcript has Stacy giving that as her reason — she treated all three problems as equally serious and explicitly unranked ("three different problems, three different kinds of risk").	Neither — that reasoning was mine, not sourced to her words.	Rewrote the exclusion to say what's actually true: funder reports was chosen because it's the most internally controlled and tractable of the three, not because Stacy ruled the board deck less important.
Section 2's third change claims the assembly work "shrinks from three sources to two," but the after-map final still shows all three sources — the grant agreement step is flagged uncertain (H13), not removed.	The after-map.	Reworded the third change to match what's actually proposed: less manual reconstruction specifically from Renée's notes, not a drop in source count.
Section 4's "by when" column says "before next check-in" for all four asks — not a real date, which the spec requires.	Neither — needs an actual date.	Replaced the placeholder with a real date. (I don't have your actual next-meeting date — you'll need to drop it in.)
The after-map's success-measure box (H15) isn't one of the three changes named in section 2 — it's a measurement criterion, not a workflow step, so it risks violating "nothing appears here that is not in section 2."	Neither, just unclear.	Kept the content but moved it to a note attached to the proposal rather than a box inside the workflow sequence itself.

One thing Claude flagged that I disagreed with, and why

I'd push back on fully separating the success-measure box from the workflow diagram. A client reading the after-map alone should be able to see what "done" looks like without flipping back to the scope document – so I'd rather keep a light version of it on the map, clearly marked as a checkpoint rather than a step, than remove it entirely.

TUE B · THE WALKTHROUGH

Link to your group doc

The sheet your group filled in with everyone's name, transcript, before-map and after-map, and then attached to Claude. One link, the same for everyone in your group. Set sharing so anyone at Launchpad can open it.

 LO-U1-P1-T06_walkthrough-prompt_group-of-three

What Claude gave us

Everything Claude sent back, pasted in full. All presenters, not just your part. Do not summarize it and do not cut the parts about your partner.

1. WOULD THEY SAY YES. Not yet. Deciding moment: "Stacey would just have to all she has to do is just filter it." Stacy told you directly, in your own earlier interview, "I don't filter things. I don't know how to filter things in most systems." Pitching "filter" back to her is re-introducing the exact word she corrected you on — a careful client catches that immediately.
2. BEFORE TO AFTER. Renée's tag → fixes "can't pull trends without asking Renée." Priya's double-check → fixes "nobody checks it before it goes out." Left alone and correctly flagged as such: the grant agreement step ("shared drive, or something else"). Left alone and not flagged: where the tag actually lives, and when Priya's check happens — these are real open questions you have on paper (H11, H14) but didn't name out loud, so a listener would think the mechanism is settled when it isn't.
3. WHAT THEY GET. "Stacey would just have to filter it" claims speed but doesn't specify what "filtering" looks like for someone who told you she won't learn a new system — this is the vague-claim problem the rubric warns about, dressed up as specific.
4. CUT THIS. Weakest: the opening — "the founder emails, founder will add Stacy what their money did for a for school she wouldn't she would have no idea she has to go to three people Renee Michael and pray." Long, garbled, and narrates Stacy's own operation back to her. Strongest 30 seconds: "Renee will also tag it, tags and metrics status for each visit along a narrative" — the clearest, most concrete line in the whole pitch.

Concrete feedback (act on this before Monday):

Said: "Stacey would just have to filter it." Say instead: "Stacy asks a plain question and gets an answer, without filtering anything herself." Why: "filter" is the word she rejected — using it again undoes the credibility you built by asking her directly.

Said: "make it all automated, same steps." Say instead: "Two things change. Everything else stays the same." Why: "automated" oversells a mechanism that's still H11/H12 — open, not built.

Said: the full opening narration of the current workflow. Say instead: one sentence — "A funder asks what their money did, and right now that costs you a week and three people." Why: she lived this; she doesn't need it re-explained at length.

Per your partners' feedback: too fast, too many filler words. Fix: pause between each named step, cut "um." Never named what's still open. Say instead: "Two things I still need from you: where Renée's tag should live, and whether Priya has time to review before it's sent." Why: naming real gaps builds trust — Stacy told you plainly she'd rather hear "this doesn't work" than see something half-baked.

Presenter 2 — Bianca

1. WOULD THEY SAY YES. No. Deciding line: "she has to compare all of these files... which most of the time they are not [accurate]." Nothing in any interview said inaccuracy happens "most of the time" — the actual

problem was that nobody reviews the report before it's sent, not that it's usually wrong. A client correcting you on your own claim mid-pitch is a lost room.

2. BEFORE TO AFTER. The "OneView dashboard" claims to fix "everything scattered," but doesn't trace to one named friction point the way the rubric wants — it's a general fix layered on top rather than a change tied to a specific pain. The "three-day auto poll" cadence appears nowhere in any interview; it's invented.

3. WHAT THEY GET. "Producing more accurate information, which all in all will be good for your business" — this is precisely the vague claim the rubric flags: "saves a ton of time" instead of "three files become one." No dimension is named concretely.

4. CUT THIS. Weakest: the entire after-pitch — "an automated system with a OneView dashboard where grants, funder info, schools, metric results, Renee's notes, payments, and QuickBooks are all in one dashboard with a three-day auto poll system." Names a product-shaped concept, merges the funder-report and board-deck workflows into one pitch, invents a number. Strongest: the before-description — "Stacey receives a question and then she has to go gather all of the information herself... a week and three person situation" — clean, accurate, close to Stacy's own words.

Concrete feedback:

Said: "OneView dashboard... three-day auto poll system." Say instead: "Renée's notes become something you can ask a question of directly." Why: this names technology and invents a cadence nobody gave you — exactly what Stacy warned against ("don't tell me something's feasible if you haven't looked").

Said: "most of the time they are not [accurate]." Say instead: "Nobody checks the numbers before they reach you — that's the risk, not that the data's usually wrong." Why: overstating the problem past what was actually said risks the client correcting you in the room.

Said: "shared to the board or funders and financials." Say instead: pick one workflow and finish that pitch before mentioning the other. Why: merging two separate problems into one dashboard makes a scoped fix sound like a full rebuild.

Said: "good for your business." Say instead: "Instead of three files, you're looking at one." Why: a countable, specific change is what makes someone want it.

Presenter 3 — Josiah

1. WOULD THEY SAY YES. Yes, tentatively. This is the strongest pitch of the three: stays on one workflow, names a specific mechanism, ties directly to a real incident. Deciding line: "automated system that checks for any incorrect information before the board deck gets built... it sends a flag to the firm... Stacy does one more check."

2. BEFORE TO AFTER. The check-before-build change directly answers the real problem: the deck going stale after the forecast rebuild, which caused the actual restricted-grant overspend. Cleanest before-to-after connection of the three. Left unaddressed: what "incorrect information" actually means — no rule for what triggers the flag — and Stacy still never gets direct visibility into QuickBooks herself.

3. WHAT THEY GET. A report that "passes" a check before reaching finance and the board — real accuracy gain, tied to a specific incident. Slightly vague on mechanism ("checks for any incorrect information" doesn't say against what), similar gap to what's still open in Nasir's H15.

4. CUT THIS. Weakest: the full before-workflow narration — "the trigger, the month ends, then Priya does the clothes and quick lips... sends it to the firm... they build the forecast... send back to Priya for review... Priya keeps the forecast..." — a step-by-step replay of Stacy's own process. Strongest: "it sends a flag to the firm so that they could rebuild the forecast... once that happens, the forecast gets sent to Stacy. She does one more check." — concrete, sequential, answers a named risk.

Concrete feedback:

Said: the full before-workflow narration. Say instead: "Every month the close gets rebuilt by an outside firm, and if anything changes after that, your deck doesn't know." Why: compressing what she already lived proves understanding without wasting her time.

Said: "checks for any incorrect information." Say instead: "Compares the deck's numbers against QuickBooks before the deck gets built — if they don't match, Priya and the firm know before you do." Why: names the actual comparison without naming a tool.

Said: "if it passes, she builds the board deck." Say instead: define "passes" — "if the numbers match, you present with confidence; if not, you know before the meeting, not during it." Why: ties the value directly to the real embarrassing incident, the strongest hook available.

Per partner feedback, ending felt thin. Say instead: close on "this is exactly what would have caught the restricted-grant overspend before it reached finance committee." Why: makes the value concrete and memorable instead of generic.

The three I am acting on

From the feedback about you, not your partner. It can come from what your partner said out loud in the room or from what Claude came back with.

What came back	What I am changing
Said "Stacey would just have to filter it" — the exact word Stacy corrected me on in the real interview	Cut "filter" entirely. Say "Stacy asks a plain question and gets an answer" instead.
Said "make it all automated, same steps" — oversells a mechanism that's actually still open (H11, H12)	Say plainly: "Two things change. Everything else stays the same." Don't call it automated until it's confirmed.
Never said out loud what's still unresolved — sounded like the tag and review step were fully designed	Name the two real open questions directly in the pitch: where Renée's tag lives, and whether Priya has time to review.

TUE C · THE CRITIQUE

Your partner read your package against the five checks. The three things you are changing.

The five checks

1. Every proposed change names the friction it removes
2. Every change names what they get back, on one of the six dimensions
3. Every problem you are not scoping gives its reason in their words
4. No technology named anywhere
5. Someone who was not in the interview could read it alone and follow it

The note	What I am changing
----------	--------------------

Partner said the after-map is hard to read as a standalone document — someone not in the room would struggle to follow it (check 5)	Simplifying the layout: fewer overlapping labels, clearer left-to-right or top-to-bottom flow, and making sure each box's text stands alone without needing the scope document open next to it

A note I am not acting on, and why

TUE D • THE PACKAGE

Five files, client-ready, in your T06 Scope Doc folder.

File	Link
Scope Document	 Untitled document

What I changed in the attachments to make them client-ready

I was just tole to make my after map more readbuly

Ahead. Read your scope document out loud, start to finish. Anything you stumble over is something a client will stumble over.

Behind. Ready for Wednesday when all five files are client-ready and you know your three changes.
